Strategic Structural Intelligence and Competitive UIRTU-Relay

SSICR | From Multi-Strategy Simulation to Comparative Advantage Maps, Strategic Worldviews, and Human Strategic Sovereignty

Authors: Sizhe Tan & GPT-Obot Release: v1.0.0 Date: October 22, 2026

KEY IDEA

SSICR extends structural intelligence from cooperative Relay to competitive and mixed-motive strategic interaction. It proposes using large-scale, multi-strategy simulations to discover context-dependent comparative advantages, preserve their evidence and failure boundaries, and progressively organize validated insights into revisable strategic principles and worldview forests. Throughout, consequential decisions and value changes remain subject to explicit human authority.

UNIFIED RESEARCH ARCHITECTURE

Strategic subjects & Relay contracts	Multi-strategy simulation & cross-play
Scoring forests & counter-evidence	Strategic Advantage Maps (SAM)
Strategic principles & worldview forests	Open-ended structural RSI
Human strategic sovereignty	Authorization, audit & revocation

RESEARCH COLLECTION

10 research papers (SSICR-001–010): strategic Relay, subject boundaries, control planes, simulation, advantage maps, worldview forests, social co-evolution, human sovereignty, open-ended RSI, and unified architecture.

4 technical specifications (SPEC-001–004): subject/Relay contracts; strategy/simulation schemas; strategic advantage maps; worldview and counter-evidence schemas.

3 illustrative case studies (CASE-001–003): competitive AI R&D organizations; open/closed/hybrid Relay strategies; strategic worldview evolution.

8 planned architecture figures and repository guides, research questions, testable hypotheses, and a staged validation roadmap.

RESEARCH STATUS & VALIDATION

Version 1.0.0 presents a conceptual framework, proposed schemas, illustrative cases, and falsifiable hypotheses—not completed empirical validation. Proposed evaluations include reproducible cross-play, out-of-distribution testing, failure-boundary calibration, counter-evidence retention, and human-authorization audits.
